The earth observation platform powered by
serco

Whatever you operate.
Wherever you operate it.

You get on day one.
gives every partner a working foundation from the moment they join the data, the infrastructure, the ecosystem you would otherwise spend years building. Whether you develop services, them, or assemble them for an end user, the foundation is already in place.

Observation data and innovative
is, ready to use
data foundation that brings together public
missions, commercial providers, ground
and partner datasets alongside a growing
of innovative solutions developed by
partners and start-ups on the platform.
ment to maintain. Pull what you need,
need it, in a consistent format across sources.

On-grade infrastructure
compute, storage, processing and orchestration
are managed by the platform. Your service inherits
performance, reliability and elastic scaling without
you operating any of it. Focus your investment where
it makes the difference: building the service your
customers value, not the layers underneath.

Identity, security and compliance, built in
Authentication, access control and audit trails are part
of the platform from day one. Your service inherits
the security posture customers expect from a Serco
platform assurance that opens doors with enterprise
customers from the very first conversation.

**A go-to-market platform you don't have
to build**
Direct access to a customer base actively buying Earth
Observation services, on a platform that handles
billing, contracts and onboarding. Bring what you do
best and let the platform turn it into revenue, faster.

An ecosystem of partners to combine with
Other partners with complementary capabilities are
already on the platform. Combine your strengths to
deliver joint solutions none of you could offer alone,
reach use cases that need more than one specialist,
and unlock contracts that would be out of reach
in isolation.

Your solutions, a new revenue stream
Bring your services, models or data products to the
platform and let other partners build on them.
Every reuse becomes a new revenue stream additional
income from work you have already done, generated
by an ecosystem that values it. The more partners use
what you offer, the more your investment pays back.

**Everything you need to build, sell
and grow already in place.**

Act with confidence.**

The earth observation platform powered by

serco

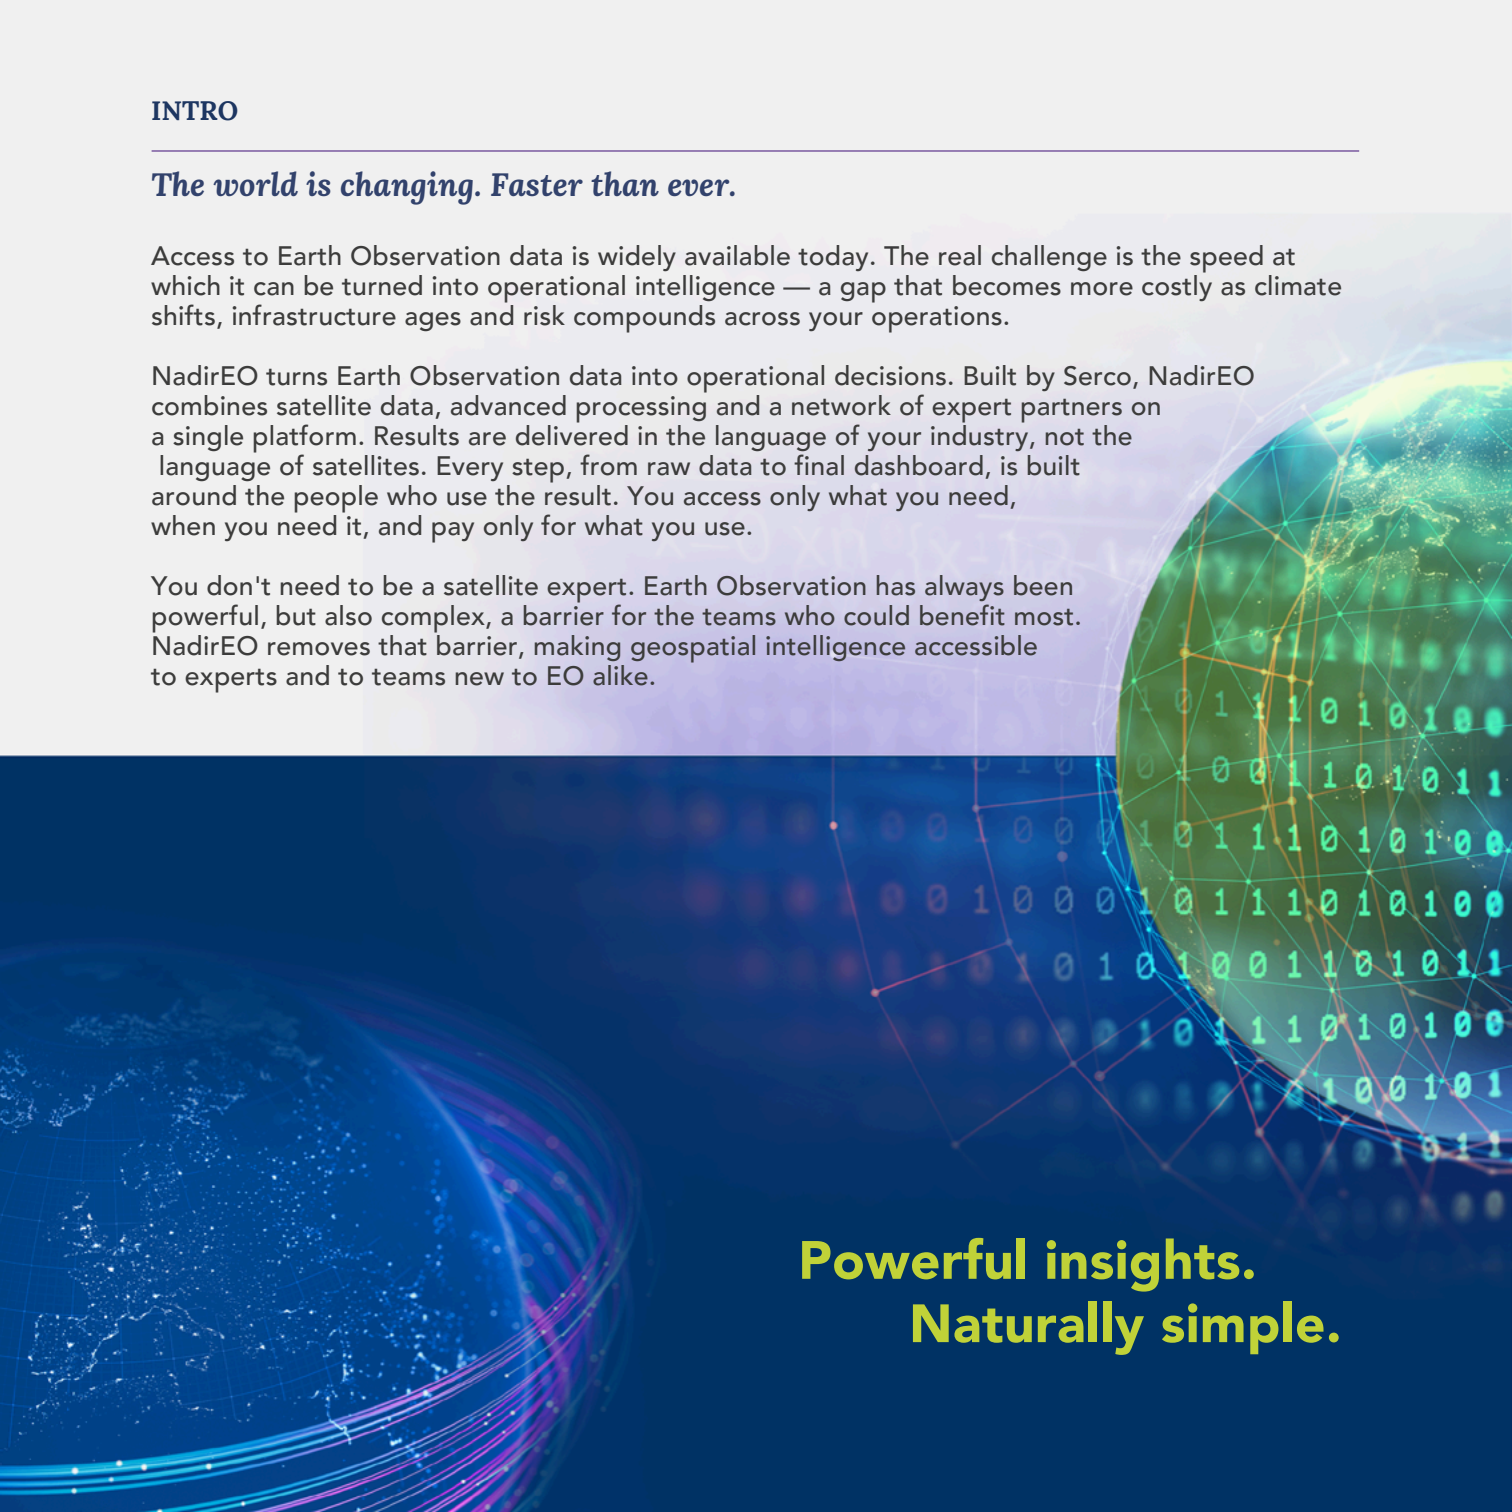

INTRO

The world is changing. Faster than ever.

Access to Earth Observation data is widely available today. The real challenge is the speed at which it can be turned into operational intelligence — a gap that becomes more costly as climate shifts, infrastructure ages and risk compounds across your operations.

NadirEO turns Earth Observation data into operational decisions. Built by Serco, NadirEO combines satellite data, advanced processing and a network of expert partners on a single platform. Results are delivered in the language of your industry, not the language of satellites. Every step, from raw data to final dashboard, is built around the people who use the result. You access only what you need, when you need it, and pay only for what you use.

You don't need to be a satellite expert. Earth Observation has always been powerful, but also complex, a barrier for the teams who could benefit most. NadirEO removes that barrier, making geospatial intelligence accessible to experts and to teams new to EO alike.

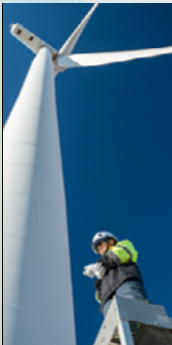

**Powerful insights.
Naturally simple.**

INDUSTRIES

Built for the way you actually work.

NadirEO is designed around the operational reality of each sector and speaks the language of each one. Whatever you operate, insure, build or protect, the platform delivers services tuned to the decisions you take.

Energy

For the entire energy value chain from utilities and asset operators to oil & gas, transmission and grid operators. Site selection, asset performance, integrity monitoring, environmental compliance and resilience to climate stress, across renewable and conventional infrastructure, onshore and offshore.

Insurance

For insurers, reinsurers and brokers across property, agriculture, parametric and specialty lines. Underwriting, exposure quantification, portfolio monitoring, post-event assessment and claims acceleration all backed by independent satellite evidence you can defend.

Infrastructure

For owners and operators of critical infrastructure transport networks, energy grids, water systems, telecom, cities and the built environment. Continuous monitoring of structural integrity, ground stability, change detection and resilience planning, at the scale your portfolio demands.

Agriculture & ESG

For agribusiness, food & beverage producers and commodity traders: crop monitoring, yield forecasting, soil and water stress, pest and disease detection across the production cycle. For sustainability and procurement teams: deforestation-free supply chain verification, regenerative practice tracking, carbon and biodiversity reporting.

**Whatever you operate.
Wherever you operate it.**

SERVICES

What Nadireo enables you to do.

A growing catalogue of services, all delivered through the same consistent experience. Use one. Combine several. Pay only for what you consume. The catalogue is open and keeps growing as new partners bring their technology to the platform.

Assess climate and geological risks

Quantify how climate change, ground subsidence, landslides and seismic activity affect your assets and territories. Historic baselines and forward-looking projections in a single view.

Quantify financial impact of climate change

Translate physical climate hazards floods, landslides, heatwaves, storms, sea-level rise into expected losses, damage costs and business-interruption impact on your assets and portfolios. Forward-looking projections under different climate scenarios, ready to feed insurance underwriting, sustainability reporting and resilience investments.

Assess wildfire risk and impact

From pre-season risk maps to near-real-time burned area assessment and recovery monitoring.

Monitor critical infrastructure

Continuous monitoring of buildings, transport networks and industrial sites, at the cadence and precision your operations require.

Track renewable energy assets

Site selection, construction monitoring and operational oversight for solar, wind and hydro infrastructure, anywhere on Earth, on a single dashboard.

Space Academy

Bring your team into the world of Earth Observation. Training paths, learning content and curated resources for everyone — from analysts taking their first steps to specialists deepening their expertise.

**One Platform.
Endless Solutions.**

FEATURES

The full power of Earth Observation, simplified.

The more critical your decisions, the more reliable your data needs to be. Every layer of NadirEO is built for resilience, openness and continuous improvement, so you can focus on what the data tells you, not on how it gets to you.

**One integration.
Continuous integration.
AI-built in.**

Multi-source data

A unified data foundation that brings together public satellite missions, commercial providers, ground sensors and partner datasets. Compare across sources independently. No single supplier, no single point of failure.

Fast results, when it matters

Results are available quickly for time-sensitive decisions where speed is part of the answer. For everything else, on-demand jobs and scheduled

pipelines run with the cadence your operations require.

AI & Machine Learning

Many services on the platform use AI to deliver concrete advantages: pattern detection at scale, anomaly identification you would miss in raw imagery, predictive modelling that anticipates change, automated classification that turns days of analyst work into minutes. And an AI assistant works alongside you in plain language: describe the

problem, and it points you to the right service. No catalogue to browse, no technical terminology to decode.

A growing partner ecosystem

New capabilities arrive continuously, validated and integrated through a single consistent experience. The platform grows richer over time, with no extra integrations to manage, no contracts to renegotiate, no workflows to rebuild.
